INTRODUCTION

The emergence of a new Coronavirus Disease, 2019-2022, has turned the globe down and disrupted main determinants of health (Zemrani et al., 2021). The world constitutes by more than 2.2 billion children, which is approximately 28% of the world’s population. According to UNICEF, 16% of the world’s population is between 10 to 19 (UNICEF, 2019). Recent study results have suggested that children are suffered by milder symptoms. 45% typical symptoms, 42% with mild respiratory symptoms were presented in COVID positive children. Whereas, 13% were asymptomatic, no child presented with life-threatening symptoms (Saleem et al., 2020). COVID-19 has a great impact on the lives of people around the world, children and adolescents also included. Compare to adult, this pandemic have an long term adverse consequences among children and adolescents mental health (Singh et al., 2020).

Keywords: adolescent; children; COVID-19; mental or psychological health; pandemic
People experienced forced to maintain social isolation, social distancing and staying at home during the lockdown and quarantine period. The results due to this situation, children are faced psychological distress and depressive mood. In addition, when the number of positive cases and deaths are increased, it had a bad impact on children and adolescents mental health such as fear of fell ill (Deolmi & Pisani, 2020).

Due to this pandemic quarantine situation, schools were closed, which had a significant change in daily activity and routinework for students. The consequence of school closure is psychological traumatic effect among students. Children missed their school-based physical activities which leads to increased obesity among children. The cancellation of sports and activity classes leads to addicted in Zoom, YouTube, Instagram, and proprietary mobile applications. The studies report present that there are several adverse effects on psychological wellbeing such as anxiety, worrying, irritability, depressive symptoms and even post-traumatic stress disorder symptoms in 18.9% to 43.7% among children in Asian, European or American countries (Cusinato et al., 2020).

This review of the scientific literature about the impact of COVID-19 pandemic in children and adolescents’ mental health due to isolation, movement restriction, social distancing. The objectives of this literature review was to examine the impact of COVID-19 pandemic on children and adolescent’s mental health.

**METHOD**

A systematic literature search was performed in accordance with PRISMA (Preferred Reporting Items for Systematic Reviews and Meta Analyses). Published studies were found using a thorough search strategy of the PubMed and Google Scholar databases from 07 April 2021 to 22 April 2021. Review literature regarding impact on mental health during COVID-19 pandemic by using the keywords “COVID-19”, “coronavirus”, “pandemic”, “mental health”, “adolescent”, “child”, “children”, “pediatric”. References of the articles also were reviewed and the corresponding abstracts and full articles were reviewed and accessed if relevant. For this literature review, specific focus was given on impact of COVID-19 on children and adolescent’s mental health. The reviewer selects only articles with English language. There was no restriction for regional articles and the date of publication. The target population for this review was up to 18 years. There were no limitations related to gender, race or health condition. Reviewer excluded the articles with data of adults and general population, repeat data points due to updates, systematic reviews, narrative reviews, brief commentaries, and editorial communications from this review. Articles about coronavirus in the general population were also excluded. According inclusion and exclusion criteria 07 articles are included for this systematic review.

The information that was extracted were as follows: study data (author, year, geographic area, study age group, study title), demographics data (including age and gender, age range), data related to psychological or mental health (anxiety, depression, sleep problem etc.) and result and conclusion from review articles. After a primary search, total of 117 publications were reviewed. After primary review, 8 articles were removed due to duplication. The remaining 109 eligible papers were reviewed initially and then 97 irrelevant articles were excluded (PRISMA flow chart: Fig. 1) and only 11 eligible articles were selected for full text review. Ultimately, 7 articles were included in the final review, including 16,169 participants. The selected studies are presented in table-1.

RESULTS

Demographics data

7 studies were selected for this systematic review. The sample size was 16,169 children and adolescents (Table 2). Age range of this study 3-18 years. For one study grade 2-6 was mentioned. The mean percentage of male and female student are 56.11% and 43.89%.

Summary of selected studies

A study was conducted oncompliance and psychological Impact of quarantine in children and adolescents due to Covid-19 Pandemic in India. The study sample was quarantined 121 children and adolescents and their parents. As a control group non-quarantined 131 children and adolescents and their parents were taken. The researcher was taking interview regarding the compliance and psychological distress during the quarantine period. The study result showed that, greater psychological distress in quarantined children and adolescents than non-quarantined children and adolescents (p <0.001). The study result present that, the percentage of worry, fear and helplessness of quarantined children and adolescents were (68.59%), (61.98%) and (66.11%) (Saurabh & Ranjan, 2020).

A study was conducted on prevalence and socio-demographic correlates of psychological health problems during the outbreak of COVID-19 among adolescents in China. The study sample was 8079 students. Online survey was done for data collection. The Patient Health Questionnaire (PHQ-9) and the Generalized Anxiety Disorder (GAD-7) questionnaire were used for this study. The study result showed that, Chinese high school students were faced depression (43.7%), anxiety (37.4%), and a combination of depression and anxiety (31.3%) during the pandemic situation. Female gender was the higher risk factor for depressive and anxiety symptoms as per multivariable logistic regression analysis and the senior high school students had the greater prevalence of depressive and anxiety symptoms in terms of grades (Jiang et al., 2020).
A study was conducted on mental health status among children in home confinement during the Coronavirus disease 2019 outbreak in Hubei Province (Data & Racial, 2020). The study result showed that, students reported depressive symptoms 22.6%, which was higher than other investigations in primary schools of China (17.2%). During the outbreak of COVID-19, children’s depressive symptoms were increased due to reduction of outdoor activities and social interaction. The study found that students reported anxiety symptoms 18.9%, which is higher than the prevalence in other surveys.

A study was performed on stress, resilience, and wellbeing in Italian Children and Their Parents during the COVID-19 Pandemic (Cusinato et al., 2020). The study sample was 463 Italian parents along with their children aged 5–17. Psychological General Well Being Index (PGWB) and Strengths and Difficulties Questionnaire (SDQ) were used to assess the parental and children’s well-being through an online survey. The study result of the independent sample t-test revealed that the children’s gender only significantly affected the prosocial behaviour scale (t455 = −4.12, p < 0.001), and females scores was higher than males (Mboys = 7.26, SE = 0.117; Mgirls = 7.94, SE = 0.116). The study present, negative correlations with all SDQ scales (values ranging from r = −0.40 to r = −0.63), only exceptional for the prosocial behaviour scale (r = 0.43). The study results conclude that due to changes in daily routine parents’ psychological dimensions were negatively affected and also exposing children’s well-being also affected.

A study was conducted on an investigation of mental health status of children and adolescents during the outbreak of COVID-19 in China (Duan et al., 2020). For this study, online convenience sampling method, questionnaires, such as Spence Child Anxiety Scale, Child Depression Inventory and Coping style Scale, were used among 359 children and 3254 adolescents. The study result showed that, anxiety levels of children and adolescents were 23.87 ± 15.79 and 29.27 ± 19.79. The percentage of depressive symptoms among children and adolescents was 22.28%.

An exploratory study was conducted on children’s anxiety and factors related to the COVID-19 pandemic among 289 children in Brazil (Andr et al., n.d.). The Children’s Anxiety Questionnaire and the Numerical Rating Scale were used among 359 children and 3254 adolescents. The study result showed that, anxiety levels of children and adolescents were 23.87 ± 15.79 and 29.27 ± 19.79. The percentage of depressive symptoms among children and adolescents was 22.28%.

A study was conducted on immediate psychological effects of quarantine in youth due to COVID-19 in Italy and Spain (Orgilés et al., 2020). The sample size was 1143. Sample was collected by survey from parents of Italian and Spanish children whose children’s age were from 3 to 18 years. The researcher collected information about how the quarantine affects their children and themselves, compared to before the home confinement. The study result showed that due to the quarantine, children’s emotional state and behaviours were changed according to 85.7% parents. According to parents, the study result found that, the most frequent symptoms were difficulty in concentration 76.6%, and the next was boredom 52%. Other psychological effects were irritability 39%, restlessness 38.8%, nervousness 38%, feelings of loneliness 31.3%, uneasiness 30.4%, and worries 30.1%. Italians’ parents reported less symptoms than Spanish.

**DISCUSSION**

Pandemic, such as COVID-19, have adverse effect on children and adolescents physical, mental, educational, social and nutritional health due to the risk of illness, protective
confinement, social isolation, school closure, fall down of family income. COVID-19 has also increased stress level among parents and caregivers, which has also affected children and adolescent’s mental health. In this literature review, 07 articles were taken for review according to PRISMA flowchart. Out of 07 literature review, 03 studies from China, 01 from India, 01 from Brazil, 01 study from Italy, and 01 study from both Italy and Spain. Among 16,169 children and adolescent, the mean percentage of male is higher 56.11% than female 43.89%. Out of 07 studies, in one study the age of students was not mentioned, the study was done according to grade of students like Grade 2-6. The lowest mentioned age of child is 3 and the highest mentioned age is 18.

From above literature review, depression was mentioned in three studies and the percentages are 43.7%%(n=8079), 22.6%(n=2330) and 22.8%(n=3613). Anxiety was mentioned in four studies and the percentages are 37.4%(n=8079), 18.9%(n=2330) and 23.87 ± 15.79 and 29.27 ± 19.79(n=3613) and in one study according to CAQ and NRS the level of anxiety was 19.4% and 21.8%. The combination of anxiety and depression 31.3% is mentioned in one study. In one study mentioned that, prosocial behaviour score is higher in females than males. In other two studies, various psychological symptoms are mentioned like worry, fear, helplessness, boredom, difficulty in concentration, irritability, restlessness, nervousness, feeling of loneliness and uneasiness due to COVID-19 pandemic.

This study supported by a literature review psychological and psychiatric impact of COVID-19 pandemic among children and adolescent (Deolmi & Pisani, 2020). The study result revealed that, due to the pandemic situation, social isolation and parenteral stress, children and adolescents are more prone to develop anxiety and depressive symptoms. There is higher risk of developing psychiatric symptoms in high grade students, females and low-income families.

Limitation
Only one reviewer reviewed all the articles, the reviewed literature is only 07, the quality of literatures also not measured. Statistical calculations was not performed and publication bias was also not checked.

CONCLUSION
So, Covid-19 pandemic has significant impact on psychological or mental health in children and adolescents. The prevalence of depression, anxiety and other psychological symptoms like worry, fear, helplessness, boredom, difficulty in concentration, irritability, restlessness, nervousness, feeling of loneliness and uneasiness are found among them. These psychological symptoms have long term effect on child’s health. So, as a nurse, we should take care of the child and society and aware the child and their parents regarding various psychological problems and its management.
